Announcements

eB2Bcom wins two major Victorian Government contracts

eB2Bcom Pty Ltd has signed a major deal to redesign the Victoria Government White pages. The Directory Service technology will utilise two core products, the Victorian-developed and -owned View500 Directory Server and the MaXware Data Synchronization Engine (DSE).

"These days organisations want to gather identity information which resides in different repositories, cleanse them and publish them onto a directory," says Manny Anthoulas, Southern Regional Manager. MaXware DSE will assist View500 directory server in enhancing identity data consistency, accuracy, and availability. The View500 directory server will be designed specifically for the needs of the Victoria Government.

eB2Bcom has also won in conjunction with Dialog a major health directory contract with the Victorian Health Region. Manny Anthoulas states, "eB2Bcom will gain a greater presence within government and the Bayside Health (Hospitals) sector".

Cybertrust appointed exclusive distributor for eB2Bcom Asia pacific

Cybertrust Asia pacific has been appointed eB2Bcoms exclusive distributor partner in Taiwan and Japan for View500. Cybertrust will be the exclusive reseller for View500 and other eB2Bcom identity management solutions for Hong Kong, China, Singapore, Malaysia, Brunei and Indonesia.

SAP Acquires eB2Bcom partner MaXware

On 14 May 2007, SAP announced that plans to acquire MaXware. MaXware delivers user provisioning, a virtual directory, data synchronisation and related identity management solutions.

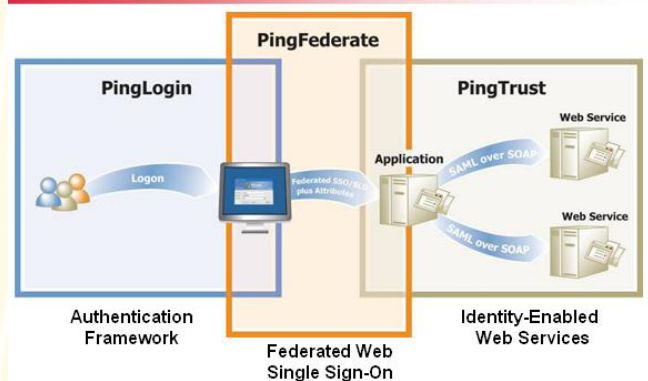

As for eB2Bcom, this acquisition will not change in terms of customer relationships with eB2Bcom in the short term. eB2Bcom will continue to provide sales and support to existing and future customers. By the next newsletter, we expect to have a product announcement in relation to SAP identity management set.

Featured Products

Ping Identity

The Ping Identity Product Family

Ping Identity specialises in Identity Management by delivering technologies and services that enable organisations to improve security, expand collaboration with trading partners and reduce the burden of regulatory compliance.

What is Federated Identity Management?

Federated Identity is a term for a set of agreements, standards and allows organisations to establish trust relationships so that identity information and authentication operations management managed by one organisation are accepted at other organisations. Federated identity enables web single sign-on across multiple domains.

Ping Identity Products

PingLogin— provides a foundation for those companies looking to re-factor their approach to consumer authentication. By centralising authentication and making additional forms of consumer authentication a plug-and-play exercise, PingLogin can reduce integration and on-going maintenance costs considerably.

PingFederate- is the federated identity server for enabling single sign-on to online services for employees, customers and business partners.

PingTrust- is a Security Token Server that extends Identity

Management Systems to Web services. With PingTrust, Web services can access digital identities to provide enhanced services while simultaneously ensuring appropriate information access and regulatory accountability.

Featured Articles

Web Application Security & SOX

An important issue facing companies today is Sarbanes-Oxley compliance, but, as the U.S. Sarbanes-Oxley Act of 2002 (SOX) is relatively new, the implementation of the regulation has not been fully established.

The requirements of SOX compliance focus on establishing a system of checks and balances for corporate financial reporting and are designed to hold executives, accountants, and auditors of public corporations to higher standards. While the requirements for SOX compliance only directly affect public corporations, there has been a trickle-down effect to private companies serving as business associates, consultants, and outsourced service providers. Given this, both public and private companies need to have an understanding of Sarbanes-Oxley compliance to ensure that their daily business practices are aligned with its specific requirements.

Featured Whitepaper

View500 & PKI

This eB2Bcom white paper describes and compares the three main ways in which Public Key Infrastructure (PKI) applications might use an LDAP or X.500 directory as a repository for application data, and points out the advantages of using eB2Bcom's View500 directory server in such deployments.

LDAP or X.500 directories are frequently used by X.509 Public Key Infrastructure (PKI) applications as repositories for certificates and certificate revocation lists (CRLs). There are three approaches PKI applications can take to finding certificates and CRLs of interest that have been stored in entries in a directory.
