Product

Brief Description

Forms

The Forms component provides Outlook clients with two additional forms and some extensions to Outlook functionality.

A Military Form is provided to allow the sending of P772 message fields supporting STANAG messaging standards and a Formal Message Form is provided for non-military messages with per-recipient notification requests. Both forms allow Security Labels to be sent.

Extensions to Outlook functionality include configurable alarms for received messages based on precedence/priority and default settings for per-recipient notification requests.

P7 Transport

This is a MAPI-compliant Transport Service Provider supporting connection to an X.400 P7 Message Store. It allows P2 and P772 messages with X.400 Security labels to be sent and received.

Multiple transports may be added to a MAPI profile and the message class configured for which messages each will process.

Features include a configurable poll time and a "Remote Mode" that allows messages in the message store to be listed and then provides a choice of which messages are actually retrieved.

MasterKeyPlus

This is a MAPI-compliant Internet directory service provider, which supports multiple LDAP directory services. It also supports an "Off-Line" mode whereby a local database of addresses from one or more directories may be built for use when the required directory is not available.

Other features include a directory "Browser" that allows easy graphical selection of message recipients and a "Check Names" function that provides additional control over recipient resolution.

e-tracker

A simple graphical means of managing read and delivery reports within Microsoft Outlook. Replaces previous product AutoCorrelator.

A button is provided for easy viewing of the status of delivery reports and receipt notifications for a message and the recipient addresses may be viewed. It is also possible to print this information.

Security

Security component supports digital signing using STANAG 4406 Military, Formal and Outlook messages using a PKCS12 interface.

This extension to Outlook enables the signing of messages using Private Key information and may be used with Outlook 2000 and Outlook XP clients. A property sheet is provided for easy configuration.

About eB2Bcom

eB2Bcom is an innovative Australian-owned company specialising in the distribution, implementation and support of best-of-breed products for Messaging, Meta-directories, identity management, secure information sharing and PKI security solutions.

eB2Bcom has head offices in Melbourne and Singapore with sales and support staff located in offices in Sydney, Melbourne, Canberra, Brisbane and Singapore.
